

## ALLOSTERIC MODULATORS OF METABOTROPIC GLUTAMATE RECEPTORS

### FIELD OF THE INVENTION

The present invention provides new compounds of formula I as modulators of metabotropic receptors – subtype 5 (“mGluR5”) which are useful for the treatment central nervous system disorders such as for example, cognitive decline, both positive and negative symptoms in schizophrenia as well as other disorders modulated by mGluR5 receptors.

### BACKGROUND OF THE INVENTION

Glutamate, the major amino-acid transmitter in the mammalian central nervous system (CNS), mediates excitatory synaptic neurotransmission through the activation of ionotropic glutamate receptors receptor-channels (iGluRs, namely NMDA, AMPA and kainate) and metabotropic glutamate receptors (mGluRs). iGluRs are responsible for fast excitatory transmission (Nakanishi S et al., (1998) *Brain Res Brain Res Rev.*, 26:230-235) while mGluRs have a more modulatory role that contributes to the fine-tuning of synaptic efficacy. Glutamate performs numerous physiological functions such as long-term potentiation (LTP), a process believed to underlie learning and memory but also cardiovascular regulation, sensory perception, and the development of synaptic plasticity. In addition, glutamate plays an important role in the pathophysiology of different neurological and psychiatric diseases, especially when an imbalance in glutamatergic neurotransmission occurs.

The mGluRs are seven-transmembrane G protein-coupled receptors. The eight members of the family are classified into three groups (Groups I, II & III) according to their sequence homology and pharmacological properties (Schoepp DD et al. (1999) *Neuropharmacology*, 38:1431-1476). Activation of mGluRs lead to a large variety of intracellular responses and activation of different transductional cascades. Among mGluR members, the mGluR5 subtype is of high interest for counterbalancing the deficit or excesses of neurotransmission in neuropsychiatric diseases. mGluR5 belongs to Group I and its activation initiates cellular responses through G-protein mediated mechanisms. mGluR5 is coupled to phospholipase C and stimulates phosphoinositide hydrolysis and intracellular calcium mobilization.

mGluR5 proteins have been demonstrated to be localized in post-synaptic elements adjacent to the post-synaptic density (Lujan R et al. (1996) *Eur J Neurosci.* 8:1488-500; Lujan R et al. (1997) *J Chem Neuroanat.*, 13:219-41) and are rarely detected in the pre-synaptic elements (Romano C et al. (1995) *J Comp Neurol.* 355:455-69). mGluR5 receptors can therefore modify the post-synaptic responses to neurotransmitter or regulate neurotransmitter release.

In the CNS, mGluR5 receptors are abundant mainly throughout cortex, hippocampus, caudate-putamen and nucleus accumbens. As these brain areas have been shown to be involved in emotion, motivational processes and in numerous aspects of cognitive function, mGluR5 modulators are predicted to be of therapeutic interest.

A variety of potential clinical indications have been suggested to be targets for the development of subtype selective mGluR modulators. These include epilepsy, neuropathic and inflammatory pain, numerous psychiatric disorders (eg anxiety and schizophrenia), movement disorders (eg Parkinson disease), neuroprotection (stroke and head injury), migraine and addiction/drug dependency (for reviews, see Brauner-Osborne H et al. (2000) *J Med Chem.* 43:2609-45; Bordi F and Ugolini A. (1999) *Prog Neurobiol.* 59:55-79; Spooren W et al. (2003) *Behav Pharmacol.* 14:257-77).

The hypothesis of hypofunction of the glutamatergic system as reflected by NMDA receptor hypofunction as a putative cause of schizophrenia has received increasing support over the past few years (Goff DC and Coyle JT (2001) *Am J Psychiatry*, 158:1367-1377; Carlsson A et al. (2001) *Annu Rev Pharmacol Toxicol.*, 41:237-260 for a review). Evidence implicating dysfunction of glutamatergic neurotransmission is supported by the finding that antagonists of the NMDA subtype of glutamate receptor can reproduce the full range of symptoms as well as the physiologic manifestation of schizophrenia such as hypofrontality, impaired prepulse inhibition and enhanced subcortical dopamine release. In addition, clinical studies have suggested that mGluR5 allele frequency is associated with schizophrenia among certain cohorts (Devon RS et al. (2001) *Mol Psychiatry.* 6:311-4) and that an increase in mGluR5 message has been found in cortical pyramidal cells layers of schizophrenic brain (Ohnuma T et al. (1998) *Brain Res Mol Brain Res.* 56:207-17).

The involvement of mGluR5 in neurological and psychiatric disorders is supported by evidence showing that in vivo activation of group I mGluRs induces a potentiation of NMDA receptor function in a variety of brain regions mainly through the activation of mGluR5 receptors (Mannaioni G et al. (2001) *Neurosci.* 21:5925-34; Awad H et al. (2000) *J Neurosci* 20:7871-7879; Pisani A et al (2001) *Neuroscience* 106:579-87; Benquet P et al (2002) *J Neurosci.* 22:9679-86)

The role of glutamate in memory processes also has been firmly established during the past decade (Martin SJ et al. (2000) *Annu. Rev. Neurosci.* 23:649-711; Baudry M and Lynch G. (2001) *Neurobiol Learn Mem.*, 76:284-297). The use of mGluR5 null mutant mice have strongly supported a role of mGluR5 in learning and memory. These mice show a selective loss in two tasks of spatial learning and memory, and reduced CA1 LTP (Lu et al. (1997) *J. Neurosci.*, 17:5196-5205; Schulz B et al. (2001) *Neuropharmacology.* 41:1-7; Jia Z et al. (2001) *Physiol Behav.*, 73:793-802; Rodrigues et al. (2002) *J Neurosci.*, 22:5219-5229).

The finding that mGluR5 is responsible for the potentiation of NMDA receptor mediated currents raises the possibility that agonists of this receptor could be useful as cognitive-enhancing agents, but also, as novel antipsychotic agents that act by selectively enhancing NMDA receptor function.

The activation of NMDARs could potentiate hypofunctional NMDARs in neuronal circuitry relevant to schizophrenia. Recent in vivo data strongly suggest that mGluR5 activation may be a novel and efficacious approach to treat cognitive decline and both positive and negative symptoms in schizophrenia (Kinney GG et al. (2002) 43:292).

mGluR5 receptor is therefore been considered as a potential drug target for treatment of psychiatric and neurological disorders including treatable diseases in this connection are Anxiety Disorders, Attentional disorders, Eating Disorders, Mood Disorders, Psychotic Disorders, Cognitive Disorders, Personality Disorders and Substance-related disorders

Most of the current modulators of mGluR5 function have been developed as structural analogues of glutamate, quisqualate or phenylglycine (Schoepp DD et al. (1999) Neuropharmacology, 38:1431-1476) and it has been very challenging to develop in vivo active and selective mGluR5 modulators acting at the glutamate binding site. A new avenue for developing selective modulators is to identify molecules that act through allosteric mechanisms, modulating the receptor by binding to site different from the highly conserved orthosteric binding site.

Positive allosteric modulators of mGluRs have emerged recently as novel pharmacological entities offering this attractive alternative. This type of molecule has been discovered for mGluR1, mGluR2, mGluR4, and mGluR5 (Knoflach F et al. (2001) Proc Natl Acad Sci U S A. 98:13402-13407; O'Brien JA et al. (2003) Mol Pharmacol. 64:731-40 ; Johnson K et al. (2002) Neuropharmacology 43:291; Johnson MP et al. (2003) J Med Chem. 46:3189-92; Marino MJ et al. (2003) Proc Natl Acad Sci U S A. 100(23):13668-73; for a review see Mutel V (2002) Expert Opin. Ther. Patents 12:1-8). DFB and related molecules were described as mGluR5 positive allosteric modulator but with low in vitro potency (O'Brien JA et al. (2003) Mol Pharmacol. 64:731-40). Recently benzamide modulators of mGluR5 receptors have been patented (WO 2004/087048). A new class of positive allosteric modulators has also been described; these molecules are aminopyrazole derivatives (C. W. Lindsley et al. (2004) J. Med. Chem. Epub 10/23/2004 jm049400d).

None of the specifically disclosed compounds are structurally related to the compounds of the present invention.

## METHODS OF SYNTHESIS

Compounds of general formula I may be prepared by methods known in the art of organic synthesis as set forth in part by the following synthesis schemes. In all of the schemes described below, it is well understood that protecting groups for sensitive or reactive groups are employed where necessary in accordance with general principles of chemistry. Protecting groups are manipulated according to standard methods of organic synthesis (T.W. Green and P.G.M. Wuts (1991) *Protecting Groups in Organic Synthesis*, John Wiley et Sons ). These groups are removed at a convenient stage of the compound synthesis using methods that are readily apparent to those skilled in the art. The selection of process as well as the reaction conditions and order of their execution shall be consistent with the preparation of compounds of formula I.

The compound of formula I may be represented as a mixture of enantiomers, which may be resolved into the individual pure *R*- or *S*-enantiomers. If for instance, a particular enantiomer of the compound of formula I is desired, it may be prepared by asymmetric synthesis, or by derivation with a chiral auxiliary, where the resulting diastereomeric mixture is separated and the auxiliary group cleaved to provided the pure desired enantiomers. Alternatively, where the molecule contains a basic functional group such as amino, or an acidic functional group such as carboxyl, this resolution may be conveniently performed by fractional crystallization from various

solvents, of the salts of the compounds of formula I with optical active acid or by other methods known in the literature, e.g. chiral column chromatography.

Resolution of the final product, an intermediate or a starting material may be performed by any suitable method known in the art as described by E.L. Eliel, S.H. Wilen and L.N. Mander (1984) *Stereochemistry of Organic Compounds*, Wiley-Interscience.

Many of the heterocyclic compounds of formula I where A is an heteroaromatic group can be prepared using synthetic routes well known in the art (A. R. Katritzky A.R. and C. W. Rees (1984) *Comprehensive Heterocyclic Chemistry*, Pergamon Press).

The product from the reaction can be isolated and purified employing standard techniques, such as extraction, chromatography, crystallization, distillation, and the like.

The compounds of formula I-A in the case with A is a triazole group of formula

and W is a 3-substituted piperidine ring may be prepared according to the synthetic sequences illustrated in the Schemes 1-3.

Wherein

P and Q each independently is aryl or heteroaryl as described above

B represents  $-C(=O)-C_0-C_2\text{-alkyl-}$ ;  $-S(=O)_2-C_0-C_2\text{-alkyl-}$ .

In the Scheme1, a nipecotic acid precursor (for example ethyl nipecotate) is reacted with an aryl or heteroaryl derivatives, for example 4-Fluoro-benzoyl chloride using method that are readily apparent to those skilled in the art. In the Scheme 1, B is as defined above, X is halogen,  $PG_1$  is a protecting group such as benzyl, *tert*-butyl, ethyl, allyl and the like. The reaction may be promoted by a base such as triethylamine, diisopropylamine, pyridine in a suitable solvent (e.g. tetrahydrofuran, dichloromethane) The reaction typically proceeds by allowing the reaction temperature to warm slowly from  $0^\circ\text{C}$  up to ambient temperature for a time in the range of about 4 up to 12 hours. Protecting groups  $PG_1$  are removed using conventional methods.

In turn, the substituted acid derivative (described in the Scheme 1) may be converted to a hydrazide derivative using the approach outlined in the Scheme 2. In

the Scheme 2, PG<sub>2</sub> is an amino protecting group such as *tert*-Butyloxycarbonyl, Benzyloxycarbonyl, Ethoxycarbonyl, Benzyl and the like. The reaction may be promoted by coupling agent known in the art of organic synthesis such as EDCI (1-(3-Dimethylaminopropyl)-3-ethylcarbodiimide), DCC (N,N'-Dicyclohexylcarbodiimide), in a suitable solvent (e.g. tetrahydrofuran, dichloromethane, N,N-dimethylformamide, dioxane). Typically, a co-catalyst such as HOBT (Hydroxybenzotriazole) will also be present in the reaction mixture. The reaction typically proceeds at room temperature for a time in the range of about 4 up to 12 hours. Protecting group PG<sub>2</sub> is removed using conventional methods.

Scheme 3 illustrates the final synthetic step.

The derivatized hydrazide is reacted with a nitrile derivative (for example 4-Fluoro-benzonitrile) under basic condition such as sodium methylate or sodium ethylate and the like in a suitable solvent (e.g. methyl alcohol, ethyl alcohol). The reaction typically proceeds by allowing the reaction temperature to warm slowly from ambient temperature to 65°C for a time in the range of about 24 hours up to 48 hours (see for example Alcalde, Ermitas; Gisbert, Maria; Perez-Garcia, Lluisa; Tetrahedron; 51; 48; 1995; 13365-13378).

In another embodiment of the invention, the compounds of formula I-A wherein A is  $\text{---}\equiv\text{---}$  and W is a 3-substituted piperidine ring may be prepared according to the synthetic sequences illustrated in the Schemes 4-6.

Wherein

Scheme 4

In accordance with the present invention, acetylenic derivatives can be prepared by methods known in the art, for example, by process described above. The free nitrogen of the piperidine moiety is protected with an amino protecting group PG<sub>2</sub>.

An appropriate aldehyde derivative, for example 3-Formyl-piperidine-1-carboxylic acid *tert*-butyl ester is converted into the corresponding unsaturated gem-

dibromide derivative in a Wittig reaction according to the method illustrated in the patent WO 02/088114. The Wittig reaction may be promoted by a mixture of methylene precursors (for example carbene tetrabromide) and a phosphine such as triphenylphosphine in a suitable solvent (e.g. dichloromethane, tetrahydrofuran, diethylether). If required a catalyst, such as zinc dust, will also be present in the reaction mixture. The reaction is typically allowed to proceed by maintaining at room temperature for a time in the range of about 12 hours up to 24 hours. The unsaturated gem-dibromide compound is then reacted with an organometallic species such as *n*-butyllithium, *tert*-Butyllithium and the like which is capable of undergoing metal exchange reaction following by dehydrohalogenation reaction. The reaction may be promoted in suitable solvent (e.g. tetrahydrofuran, ether and the like) at a temperature between -78°C for 1 hour.

The Scheme 5 illustrates the preparation of disubstituted acetylenic derivatives by reacting an alkyne derivative (described in the Scheme 4), for example 3-Ethynyl-piperidine-1-carboxylic acid *tert*-butyl ester, with a substituted P, for example 1-Fluoro-4-iodo-benzene. Thus in Scheme 5, X includes halides such as Cl, Br, I or trifluoromethanesulfonyl and paratoluenesulfonyl. Such general route of synthesis has been reported in *J. Med. Chem.* 2000, 43, 4288-4312.

Scheme 5

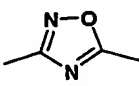

This palladium catalyzed C-C coupling reaction requires a catalyst such as  $\text{PdCl}_2(\text{PPh}_3)_2$ ,  $\text{Pd}(\text{PPh}_3)_4$ ,  $\text{Pd}(\text{OAc})_2$  or Pd on carbon in a suitable solvent like DMF, acetonitrile or benzene. Typically a co-catalyst such as copper(I) iodide and a base (e.g., triethylamine, diisopropylamine, potassium acetate...) will also be present in the reaction mixture. The coupling reaction typically proceeds by allowing the reaction temperature to warm slowly from about 0° up to ambient temperature, or heated to a temperature anywhere between 30°C and 150°C. The reaction mixture is then maintained at a suitable temperature for a time in the range of about 1 up to 24 hours, with about 12 hours typically being sufficient. Protecting groups  $\text{PG}_2$  are removed using standard methods.

The reaction typically proceeds by allowing the reaction temperature to warm slowly from ambient temperature to a temperature range of  $70^\circ\text{C}$  up to  $80^\circ\text{C}$  inclusive for a time in the range of about 1 hour up to 48 hours inclusive (see for example Lucca, George V. Typically, a co-catalyst such as HOBT (Hydroxy-

benzotriazole), HOAT (1-Hydroxy-7-azabenzotriazole) may also be present in the reaction mixture. The reaction typically proceeds at a temperature in the range of ambient temperature up to 60°C inclusive for a time in the range of about 2 hours up to 12 hours to produce the intermediate acyl-amidoxime. The cyclisation reaction may be effected thermally in a temperature range of about 80°C up to about 150°C for a time in the range of about 2 hours up to 18 hours (see for example Suzuki, Takeshi; Iwaoka, Kiyoshi; Imanishi, Naoki; Nagakura, Yukinori; Miyata, Keiji; et al.; Chem.Pharm.Bull.; EN; 47; 1; 1999; 120 - 122). The product from the reaction can be isolated and purified employing standard techniques, such as extraction, chromatography, crystallization, distillation, and the like.

The final step may be effected either by a process described in the Scheme 9 or by a process described in the Scheme 10.

The coupling reaction may be promoted by coupling agents known in the art of organic synthesis such as EDCI (1-(3-Dimethylaminopropyl)-3-ethylcarbodiimide), DCC (N,N'-Dicyclohexyl-carbodiimide) or by polymer-supported coupling agents such as polymer-supported carbodiimide (PS-DCC, ex Argonaut Technologies), in the presence of a suitable base such as triethylamine, diisopropyl-ethylamine, in a suitable solvent (e.g. tetrahydrofuran, dichloromethane, N,N-dimethylformamide, dioxane). Typically, a co-catalyst such as HOBT (1-Hydroxy-benzotriazole), HOAT (1-Hydroxy-7-azabenzotriazole) and the like may also be present in the reaction mixture. The reaction typically proceeds at ambient temperature for a time in the range of about 2 hours up to 12 hours.

Scheme 13

In the Scheme 13, piperazine-2-carboxylic acid is selectively protected at the nitrogen atom at position 4.  $PG_2$  is an amino protecting group such as t-butyloxycarbonyl and the like. This reaction may be performed using agents such as 2-(Boc-oxymino)-2-phenylacetonitrile, di-tertbutyl-dicarbonate and the like in a suitable organic solvent (e.g. dioxane, tetrahydrofuran) in mixture with water. Typically, the pH of the reaction mixture will be adjusted to a value in the range of 8 to 12, by addition of a suitable base such as sodium hydroxide, potassium hydroxide, triethylamine and the like. The reaction typically proceeds at room temperature for a time in the range of about 1 hour up to 4 hours (see for example: Bigge, Christopher F.; Hays, Sheryl J.; Novak, Perry M.; Drummond, James T. et al.; Tetrahedron Letters; 30, 39; 1989; 5193-5196 and WO 2004/022061). The  $N^4$ -protected piperazine derivative can be converted to a piperazine derivative substituted at position 1, using standard conditions for reductive amination.  $R_{11}$  may be for instance C1-C6-alkyl, C3-C6-cycloalkyl, C3-C7-cycloalkylalkyl, arylalkyl, heteroarylalkyl. Typically, addition of an acid to decrease the pH of the reaction mixture to a pH of less than about 7 may be necessary to effect reaction, wherein the acid is added as needed and the acid is such as acetic acid, hydrochloric acid and the like. The reaction typically proceeds at room temperature for a time in the range of about 2 hours up to 4 hours.

The Scheme 32 illustrates the preparation of disubstituted ethylenic derivatives by reacting an protected vinyl piperidine, with a substituted P, for example 1-Fluoro-4-iodo-benzene. Thus in Scheme 5, X includes halides such as Cl, Br, I or trifluoromethanesulfonyl and paratoluenesulfonyl. Such general route of synthesis has been reported in Artzhur D: Brosius and al.; *JACS*. 1999, 121, 700-709.

Scheme 32

This palladium catalyzed C-C coupling reaction requires a catalyst such as  $PdCl_2(PPh_3)_2$ ,  $Pd(PPh_3)_4$ ,  $Pd(OAc)_2$  or Pd on carbon in a suitable solvent like DMF, acetonitrile or benzene. Typically a co-catalyst such as copper(I) iodide and a base

(e.g., triethylamine, diisopropylamine, potassium acetate...) will also be present in the reaction mixture. The coupling reaction typically proceeds by allowing the reaction temperature to warm slowly from about 0° up to ambient temperature, or heated to a temperature anywhere between 30°C and 150°C. The reaction mixture is then maintained at a suitable temperature for a time in the range of about 1 up to 24 hours, with about 12 hours typically being sufficient. Protecting groups PG<sub>2</sub> are removed using standard methods.

The precursor protected vinyl piperidine derivative is prepared according to synthetic routes well known in the art (see for example Artzhur D: Brosius and al.; *JACS*. 1999, 121, 700-709).

The compounds of formula I-A in the case where A is a group of formula and W is a 3-substituted piperidine ring may be prepared according to the synthetic sequences illustrated in the Scheme 33.

Wherein

P and Q each independently is aryl or heteroaryl as described above  
B represents  $-C(=O)-C_0-C_2\text{-alkyl-}$ ;  $-S(=O)_2-C_0-C_2\text{-alkyl-}$ .

In the Scheme 33, PG<sub>2</sub> is an amino protecting group such as *tert*-Butyloxycarbonyl, Benzyloxycarbonyl, Ethoxycarbonyl, Benzyl and the like, B is as defined above, X is halogen. The amide formation may be promoted by coupling agents known in the art of organic synthesis such as EDCI (1-(3-Dimethylaminopropyl)-3-ethylcarbodiimide), DCC (N,N'-Dicyclohexyl-carbodiimide), in a suitable solvent (e.g. tetrahydrofuran, dichloromethane, N,N-dimethylformamide, dioxane). Typically, a co-catalyst such as HOBT (Hydroxybenzotriazole) will also be present in the reaction mixture. The reaction typically proceeds either at room temperature or at a temperature in the range of 40°C up to 80°C inclusive, for a time in the range of about 4 hours up to 48 hours. Protecting groups PG<sub>2</sub> are removed using conventional methods. The final step indicated in the Scheme 33 may be promoted by a base such as triethylamine, diisopropylamine, pyridine in a suitable solvent (e.g. tetrahydrofuran, dichloromethane). The reaction typically proceeds by allowing the reaction temperature to warm slowly from 0°C up to ambient temperature for a time in the range of about 2 up to 12 hours.

The compounds of Formula I which are basic in nature can form a wide variety of different pharmaceutically acceptable salts with various inorganic and organic acids. These salts are readily prepared by treating the base compounds with a substantially equivalent amount of the chosen mineral or organic acid in a suitable organic solvent such as methanol, ethanol or isopropanol (see P. Heinrich Stahl, Camille G. Wermuth, *Handbook of Pharmaceuticals Salts, Properties, Selection and Use*, Wiley, 2002).

The following non-limiting examples are intended to illustrate the invention. The physical data given for the compounds exemplified is consistent with the assigned structure of those compounds.

### PHARMACOLOGY:

The compounds provided in the present invention are positive allosteric modulators of mGluR5. As such, these compounds do not appear to bind to the orthosteric glutamate recognition site, and do not activate the mGluR5 by themselves. Instead, the response of mGluR5 to a concentration of glutamate or mGluR5 agonist is increased when compounds of Formula I are present. Compounds of Formula I are expected to have their effect at mGluR5 by virtue of their ability to enhance the function of the receptor.

## EXAMPLE A

### mGluR5 binding assay on rat brain membrane preparation

Activity of compounds of the invention was examined following a radioligand binding technique using rat cortical membranes and tritiated 2-methyl-6-(phenylethynyl)-pyridine ( $[^3\text{H}]$ -MPEP) as a ligand following similar methods than those described in Gasparini et al. (2002) Bioorg. Med. Chem. Lett 12: 407-409 and in Anderson et al. (2002) J. Pharmacol. Exp. Ther. 303: 1044-1051.

#### **Membrane preparation:**

Cortices were dissected out from brains of 200-300g Sprague-Dawley rats (Charles River Laboratories, L'Arbresle, France). Tissues were homogenized in 10 volumes (vol/wt) of ice-cold 50 mM HEPES-NaOH (pH 7.4) using a Polytron disrupter (Kinematica AG, Luzern, Switzerland) and centrifuged for 30 min at 40,000 g. (4°C). The supernatant was discarded and the pellet washed twice by resuspension in 10 volumes 50 mM HEPES-NaOH. Membranes were then collected by centrifugation and washed before final resuspension in 10 volumes of 20 mM HEPES-NaOH, pH 7.4. Protein concentration was determined by the Bradford method (Bio-Rad protein assay, Reinach, Switzerland) with bovine serum albumin as standard.

#### **$[^3\text{H}]$ -MPEP binding experiments:**

Membranes were thawed and resuspended in binding buffer containing 20 mM HEPES-NaOH, 3 mM  $\text{MgCl}_2$ , 3 mM  $\text{CaCl}_2$ , 100 mM NaCl, pH 7.4. Competition studies were carried out by incubating for 1h at 4°C: 3 nM  $[^3\text{H}]$ -MPEP (39 Ci/mmol, Tocris, Cookson Ltd, Bristol, U.K.), 50  $\mu\text{g}$  membrane and a concentration range of 0.003 nM- 30  $\mu\text{M}$  of compounds, for a total reaction volume of 300  $\mu\text{l}$ . The non-specific binding was defined using 30  $\mu\text{M}$  MPEP. Reaction was terminated by rapid filtration over glass-fiber filter plates (Unifilter 96-well GF/B filter plates, Perkin-Elmer, Schwerzenbach, Switzerland) using 4 x 400  $\mu\text{l}$  ice cold buffer using cell harvester (Filtermate, Perkin-Elmer, Downers Grove, USA). Radioactivity was determined by liquid scintillation spectrometry using a 96-well plate reader (TopCount, Perkin-Elmer, Downers Grove, USA).

#### **Data analysis:**

The inhibition curves were generated using the Prism GraphPad program (Graph Pad Software Inc, San Diego, USA).  $\text{IC}_{50}$  determinations were made from at least three independent experiments and data were obtained from 8 point-concentration response curves using a non linear regression analysis.

Compounds within the present invention have the ability to inhibit  $[^3\text{H}]$ -MPEP binding in rat cortical membrane with  $\text{IC}_{50}$  less than about 100  $\mu\text{M}$ , or less than about 30  $\mu\text{M}$  and 10  $\mu\text{M}$  and preferentially less than about 3  $\mu\text{M}$ .

## EXAMPLE B

### mGluR5 assay on rat cultured cortical astrocytes

Under exposure to growth factors (basic fibroblast growth factor, epidermal growth factor), rat cultured astrocytes express group I-Gq coupled mGluR transcripts, namely

mGluR5, but none of the splice variants of mGluR1, and as a consequence, a functional expression of mGluR5 receptors (Miller et al. (1995) J. Neurosci. 15:6103-9): The stimulation of mGluR5 receptors with selective agonist CHPG and the full blockade of the glutamate-induced phosphoinositide (PI) hydrolysis and subsequent intracellular calcium mobilization with specific antagonist as MPEP confirm the unique expression of mGluR5 receptors in this preparation.

This preparation was established and used in order to assess the properties of the compounds of the present invention to increase the  $\text{Ca}^{2+}$  mobilization-induced by glutamate without showing any significant activity when applied in the absence of glutamate.

#### **Primary cortical astrocytes culture:**

Primary glial cultures were prepared from cortices of Sprague-Dawley 15 days old embryos using a modification of methods described by Mc Carthy and de Vellis (1980) J. Cell Biol. 85:890-902 and Miller et al. (1995) J. Neurosci. 15(9):6103-9. The cortices were dissected and then dissociated by trituration in a sterile buffer containing 5.36 mM KCl, 0.44 mM  $\text{NaHCO}_3$ , 4.17 mM  $\text{KH}_2\text{PO}_4$ , 137 mM NaCl, 0.34 mM  $\text{NaH}_2\text{PO}_4$ , 1 g/L glucose. The resulting cell homogenate was plated onto poly-D-lysine precoated T75 flasks (BIOCOAT, Becton Dickinson Biosciences, Erembodegem, Belgium) in Dubelcco's Modified Eagle's Medium (D-MEM GlutaMAX<sup>TM</sup> I, Invitrogen, Basel, Switzerland) buffered with 25 mM HEPES and 22.7 mM  $\text{NaHCO}_3$ , and supplemented with 4.5g/L glucose, 1 mM pyruvate and 15 % fetal calf serum (FCS, Invitrogen, Basel, Switzerland), penicillin and streptomycin and incubated at 37°C with 5%  $\text{CO}_2$ . For subsequent seeding, the FCS supplementation was reduced to 10 %. After 12 days, cells were subplated by trypsinisation onto poly-D-lysine precoated 384-well plates at a density of 20.000 cells per well in culture buffer supplemented with 5 ng/ml  $\beta$ FGF (basic fibroblast growth factor) (Invitrogen, Basel, Switzerland) and 10 ng/ml EGF (epidermal growth factor) (Invitrogen, Basel, Switzerland).

#### **$\text{Ca}^{2+}$ mobilization assay using rat cortical astrocytes:**

After 2 days incubation, cells were washed with Assay buffer containing: 142 mM NaCl, 6 mM KCl, 1 mM  $\text{Mg}_2\text{SO}_4$ , 1 mM  $\text{CaCl}_2$ , 20 mM HEPES, 1 g/L glucose, 0.125 mM sulfinpyrazone, pH 7.4. After 60 min of loading with 4  $\mu\text{M}$  Fluo-4 (TefLabs, Austin, TX), the cells were washed three times with 50  $\mu\text{l}$  of PBS Buffer and resuspended in 45  $\mu\text{l}$  of Assay Buffer. The plates were then transferred to a Fluorometric Imaging Plate Reader (FLIPR, Molecular Devices, Sunnyvale, CA) for the assessment of intracellular calcium flux. After monitoring the fluorescence for 15 s in order to establish a baseline, DMSO solutions containing various concentrations of representative compounds of the present invention diluted in Assay Buffer (15  $\mu\text{l}$  of 4X dilutions) were added to the cell plate in absence or in presence of 1  $\mu\text{M}$  of glutamate: 1  $\mu\text{M}$  glutamate, the concentration that gives 20 % of the maximal response of glutamate ( $\text{EC}_{20}$ ) in our experimental conditions and in accordance to published data, was the concentration used to detect the positive allosteric modulator properties of the compounds from the present invention. The final DMSO concentration in the assay was 0.3 %. In each experiment, fluorescence was then monitored as a function of time for 3 minutes and the data analyzed using Microsoft Excel and GraphPad Prism. Each data point was also measured two times.

**Data analysis:**

The concentration-response curves of representative compounds of the present invention in the presence of EC<sub>20</sub> of glutamate were generated using the Prism GraphPad program (Graph Pad Software Inc, San Diego, USA). The curves were fitted to a four-parameter logistic equation ( $Y = \text{Bottom} + (\text{Top} - \text{Bottom}) / (1 + 10^{-(\text{LogEC}_{50} - X) * \text{HillSlope}})$ ) permitting the determinations of EC<sub>50</sub> values. Each curve was performed using triplicate sample per data point and 8 concentrations.

Data presented in the Figure 1 represent the ability of 3  $\mu\text{M}$  of the examples # 12, # 55 and # 56 to increase the stimulation induced by 1  $\mu\text{M}$  of glutamate in primary cortical mGluR5-expressing cell culture. Examples # 12, # 55 and # 56 have no statistically significant agonistic activity when tested in the absence of glutamate, as compared to buffer value.

Each bargraph is the mean and S.E.M of triplicate data points and is representative of three independent experiments

Figure 1 shows an increase of 1  $\mu\text{M}$  glutamate-induced  $\text{Ca}^{2+}$  mobilization in rat cultured astrocytes in the presence of 3  $\mu\text{M}$  of examples # 12, 55 and 56 of the present invention.

The results shown in Example A and Example B demonstrate that the compounds described in the present invention do not have an effect per se on mGluR5. Instead, when compounds are added together with an mGluR5 agonist like glutamate or CHPG, the effect measured is significantly potentiated compared to the effect of the agonist alone at the same concentration. In addition, the compounds of the present invention have the ability to inhibit the binding of a mGluR5 negative allosteric modulator in rat cortical membrane preparation, a property recently described for 3,3'-Difluorobenzaldazine (DFB), another mGluR5 positive allosteric modulator (O'Brien JA et al (2003) Mol Pharmacol. 64:731-40). In addition, DFB is not able to inhibit the binding of [3H]-quisqualate to the orthosteric glutamate site (O'Brien JA et al (2003) Mol Pharmacol. 64:731-40). Taken together, these data indicate that the compounds of the present invention are positive allosteric modulator of mGluR5 receptor in native preparation and do not appear to bind to the orthosteric binding site of the receptor.

Thus, the positive allosteric modulators provided in the present invention are expected to increase the effectiveness of glutamate or mGluR5 agonists at mGluR5 receptor. Therefore, these positive allosteric modulators are expected to be useful for treatment of various neurological and psychiatric disorders associated with glutamate dysfunction described to be treated herein and others that can be treated by such positive allosteric modulators.

**EXAMPLE C****Animal Models of Schizophrenia****Phencyclidine (PCP) model of schizophrenia**

PCP-induced increases in locomotor ambulation are a widely accepted animal model of schizophrenia. This model is based on the evidence that phencyclidine induces a

schizophrenia-like syndrome in humans including increased motor behaviors, disruption of cognition and impairment of working memory (Steinpreis RE (1996) *Behav Br Res.* 74:45-55; Abi-Saab et al. (1998) *Pharmacopsychiatry*, 31:104-109). Further, it has also been shown that antipsychotic drugs that are effective in the treatment of schizophrenia reduce the locomotor activating effect of PCP (Gleason & Shannon (1997) *Psychopharmacology*, 129:79-84). These results demonstrate that locomotor activation induced by PCP is a useful model for screening of compounds which may be useful in the treatment of schizophrenia.

#### **Amphetamine model of schizophrenia**

Amphetamine-induced increases in locomotor ambulation are well known and are widely used as a model of the positive symptoms of schizophrenia. This model is based on evidence that amphetamine increases motor behaviors and can induce a psychotic state in humans (Yui et al. (2000) *Ann NY Acad Sci* 914:1-12). Further, it is well known that amphetamine-induced increases in locomotor activity are blocked by antipsychotics drugs that are effective in the treatment of schizophrenia (Arnt (1995) *Eur J Pharmacol* 283:55-62). These results demonstrate that locomotor activation induced by amphetamine is a useful model for screening of compounds which may be useful in the treatment of schizophrenia.

**Subjects:** The present studies were performed in accordance with the animal care and use policies of Addex Pharmaceuticals and the laws and directives of Switzerland governing the care and use of animals. Male C57BL6/j mice (20-30 g) 7 weeks of age at the time of delivery were group housed in a temperature and humidity controlled facility on a 12 hour light /dark cycle for at least 7 days before use. Mice had access to food and water ad libitum except during locomotor activity experiments.

**Assessment of locomotor (ambulatory) activity:** The effects of compounds on PCP- or amphetamine-induced locomotor activation in mice were tested. Locomotor activity of mice was tested in white plastic boxes 35 cm X 35 cm square with walls 40 cm in height. Locomotor activity (ambulations) was monitored by a videotracking system (VideoTrack, Viewpoint, Champagne au Mont d'Or, France) that recorded the ambulatory movements of mice. Mice were naïve to the apparatus prior to testing. On test days, test compounds (10, 30, 50 or 100 mg/kg i.p. (intraperitoneal)) or vehicle were administered 120 minutes before the PCP (5 mg/kg s.c.(sub-cutaneous)), amphetamine (3.0 mg/kg s.c.) or saline injection. Mice were placed into the locomotor boxes immediately after the PCP, amphetamine or saline vehicle injection and their locomotor activity, defined as the distance traveled in centimeters (cm), was measured for 60 minutes.

**Compound administration:** Compounds were prepared as a microsuspension in sterile water (60% of final volume) and Labrafil M1944 CS (apricot kernel oil – Gattefossé, Saint Priest, France) (40% of final volume) and administered in a volume of 10 ml/kg. Compound-vehicle-treated mice received the equivalent volume of vehicle solution i.p. in the absence of added compound. PCP hydrochloride (Sigma, Switzerland) was dissolved in saline and was administered at a dose of 5 mg/kg s.c. in a volume of 10 ml/kg. PCP-vehicle-treated mice received an equal volume of saline vehicle injected s.c. D-amphetamine sulfate (Amino AG, Neuenhof, Switzerland) was dissolved in saline and administered at a dose of 3.0 mg/kg s.c. in a volume of 10

ml/kg. D-amphetamine-vehicle-treated mice received an equivalent volume of saline vehicle injected s.c.

**Statistical analyses:** Statistical analyses were performed using GraphPad PRISM statistical software (GraphPad, San Diego, CA, USA). Data were analyzed using one-way analysis of variance (ANOVA) followed by post-hoc Bonferroni-corrected multiple comparisons, where appropriate. The significance level was set at  $p < 0.05$ .

#### **Effect of compounds on PCP-induced locomotor activity in mice**

Data from such an experiment using a representative compound is shown in Figure 2.

Figure 2 shows the representative compound of the invention significantly attenuated the increase in locomotor activity induced by PCP ( $f = 13.39$ ,  $df = (2, 45)$ ,  $n = 16/\text{group}$ ) at a dose of 100 mg/kg ip.

#### **Effect of compounds on amphetamine-induced locomotor activity in mice**

Data from such an experiment using a representative compound is shown in Figure 3.

Figure 3 shows the representative compound of the invention significantly attenuated the increase in locomotor activity induced by amphetamine ( $f = 13.04$ ,  $df = (4, 82)$   $n = 8-33$  mice per group) at doses of 50 & 100 mg/kg ip.

#### **Summary of in vivo data**

The data presented above shows that representative compounds of Formula 12 significantly attenuate the hyperlocomotor effects of PCP and amphetamine, two widely accepted animal models of schizophrenia. These results support the potential of compounds of Formula I in the treatment of schizophrenia and related disorders.

The compounds of the present invention are allosteric modulators of mGluR5 receptors, they are useful for the production of medications, especially for the prevention or treatment of central nervous system disorders as well as other disorders modulated by this receptor.

The compounds of the invention can be administered either alone, or in combination with other pharmaceutical agents effective in the treatment of conditions mentioned above.
